# Multi Update Modules

Multi Update Modules

Allows the user to update multiple modules at the same time.

- The goal of this module is to allow the user update more than one module at the same time.

- To achieve this, the user must activate the **Tree View** of the Apps menu and select the checkbox of all apps that they wish to update.

- After that, simply click on the gear icon on the middle-upper section and select the option **Update Modules**.

- This is enough to update fields and some views, but since most browsers save a cache of data, some views will require a **page reload** or refresh to update its date on the user end. Therefore, execute a page refresh, and the updates will be completely applied.
